Boot Logo Generator — User Manual

Oct 14, 2026 · @Mamadou BA

1. Overview

The Boot Logo Generator (version 1.2.0) creates the image sequence that makes up the boot animation of a 3D printer's screen. It suits any printer whose boot animation is a series of images: you only need to match the original image count, size and numbering.

The default settings match the Ender-3 V3 SE: 39 PNG images of 200 × 89 pixels, named `2386_200x89.png` to `2424_200x89.png`, ready to replace the original images in the `tjc.tft` file. This manual uses that printer as its example; on another printer, the screen file name and the image size may differ.

You choose the text (one or two lines), the font, the colors, the background, the animation style and the number of images. An animated preview updates with every change.

The interface is bilingual (French / English). The software is released under the GNU GPL v3 license.

2. Installation

Windows version (recommended). Double-click `Generateur_Logo_Demarrage.exe`. No Python installation is needed. The first launch takes a few seconds while the program unpacks itself.

If Windows shows "Windows protected your PC", click **More info**, then **Run anyway**. This message appears because the file is not digitally signed.

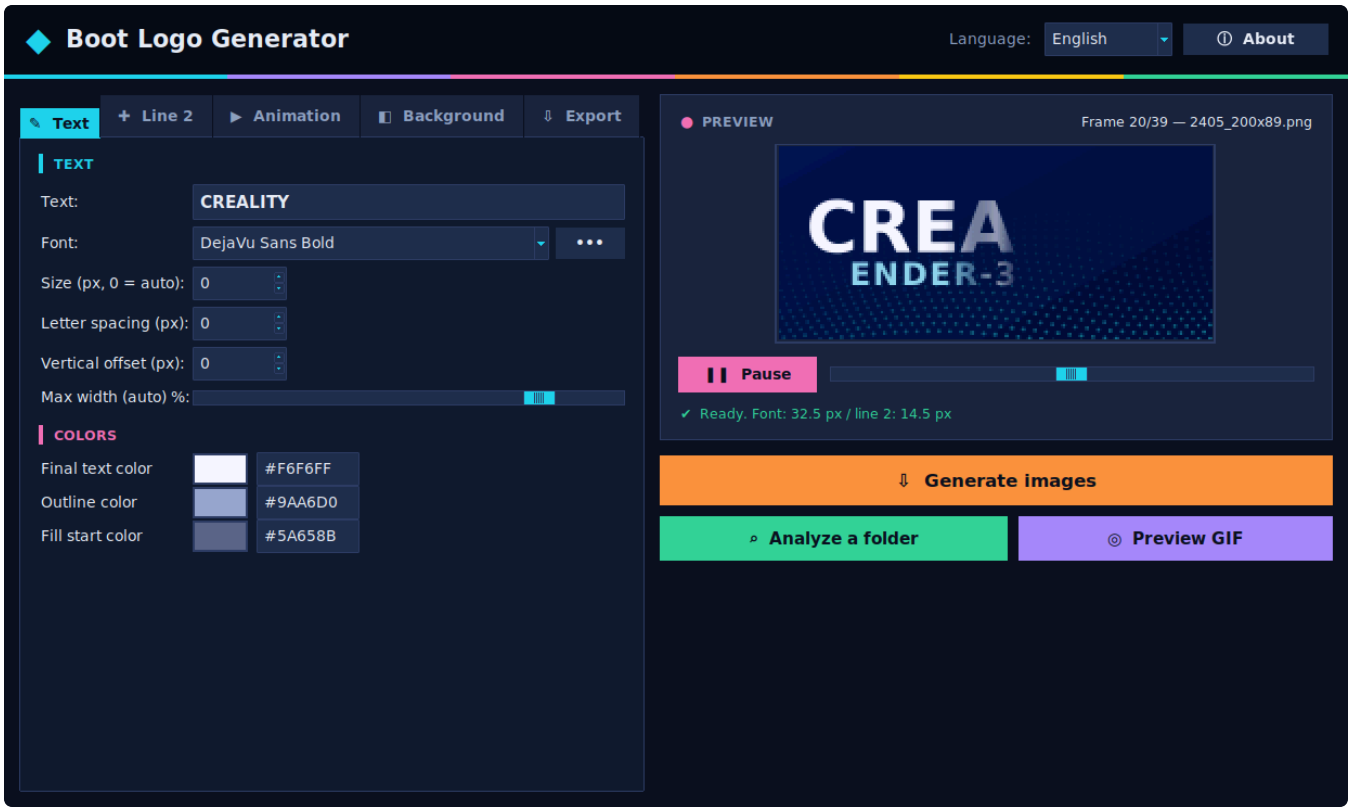

From the source code (Windows, macOS, Linux). Python 3.9 or later is required.

1. Unzip `Generateur_Logo_Demarrage_source.zip`.
2. In that folder, install the dependencies: `pip install -r requirements.txt` (Pillow and NumPy).
3. Start the program: `python generateur_logo_demarrage.py`.

To rebuild the exe yourself, install PyInstaller (`pip install pyinstaller`), then run the command given in `LISEZMOI.md`.

3. Interface overview

The window has three areas: settings on the left, the preview on the right and the action buttons below the preview.

Area	Location	Purpose
Header	Top of the window	Language choice (Français / English), Manual button (opens this manual, F1 key) and **About** button
Settings tabs	Left	Text, Line 2, Animation, Background, Export (active tab in cyan)
Preview	Right	Looping animation, number and file name of the frame shown
Play / Pause and slider	Below the preview	Stop the animation and step through the frames one by one
Status line	Below the slider	Yellow while rendering, green when ready (with font size), pink on error

Area	Location	Purpose
Generate images (orange)	Below the preview	Saves the image sequence to a folder
Analyze a folder (green)	Below the preview	Copies the settings of an existing image set
Preview GIF (violet)	Below the preview	Saves the animation as a GIF enlarged × 2

To change a color, click its swatch to open the color picker, or type the hex code directly (for example `#F6F6FF`). The ••• button next to a field opens the file browser.

4. Creating a logo step by step

A first logo takes about five minutes, starting from the image folder extracted from your `tjc.tft`.

1. **Analyze the original folder.** Click **Analyze a folder** (green) and select the folder holding images `2386_200x89.png` to `2424_200x89.png`. The program picks up the image count, the size and the first number.
2. **Keep the original background.** The program offers to use the first image as the background. Answer **Yes**: that image holds only the Creality background, without text.
3. **Type your text.** In the **Text** tab, type the text and choose the font. Leave the size at 0 so it adjusts itself.
4. **Add a second line if needed.** In the **Line 2** tab, tick the box and type the second text.
5. **Choose the animation.** In the **Animation** tab, click a style. Watch the result in the preview.
6. **Check frame by frame.** Click **Pause**, then drag the slider to inspect each frame.
7. **Generate the images.** Click **Generate images** (orange) and choose an **empty** folder. The program saves the 39 images there.
8. **Export a GIF (optional).** Click **Preview GIF** (violet) to get the animation to show or publish.

If the chosen folder already holds files with the same names, the program asks for confirmation before replacing them.

5. Settings reference

Every setting shows in the preview within a second. Sizes are in pixels of the final image (200 × 89).

Text tab

Setting	Default	Effect
Text	CREALITY	Main text
Font	Arial Black (Windows)	Fonts installed on the computer, or a .ttf / .otf file via •••
Size	0 (auto)	0 = the text fills the maximum width; otherwise a fixed size in px
Letter spacing	0	Space added between letters; negative = tighter letters
Vertical offset	0	Moves the whole text block up (negative) or down (positive)
Max width (auto)	88 %	Width taken by the text when the size is automatic
Final text color	#F6F6FF	Text color on the last frame
Outline color	#9AA6D0	Color of the stroke (Creality style)
Fill start color	#5A658B	Fill color at the start of the fade

Line 2 tab

Setting	Default	Effect
Add a second line	Unticked	Shows a second text below the first
Text	ENDER-3 V3 SE	Text of the second line
Font	Same font as line 1	Or any other installed font, or one chosen via •••
Size	0 (auto)	0 = 45 % of the first line's size
Letter spacing	1	As for line 1

Setting	Default	Effect
Gap between lines	4	Vertical space between the two lines
Final color of line 2	#8FD3E8	Separate color for the second line

With automatic size, both lines are sized and centered together as a single block.

Animation tab

Style	What happens
Outline drawn then filled (Creality style)	Outlines are drawn in segments, thicken, then the fill fades in
Fade in	The text appears gradually
Letter by letter	Each letter appears in turn, line 1 then line 2
Light sweep	A beam of light reveals the text from left to right
Zoom in	The text grows as it appears

Setting	Default	Effect
Number of frames	39	Length of the sequence; must match the original
Still frames at the end	0	Identical last frames, to keep the logo on screen longer
Stroke variant (seed)	7	Changes the order in which outlines are drawn (Creality style only)

Background tab

Background type	Settings used
Wavy dot field (Creality style)	Color 1 = background, color 2 = dots
Solid color	Color 1
Vertical gradient	Color 1 at the top, color 2 at the bottom

Background type	Settings used
Image	File chosen via •••; it is cropped to fill 200 × 89

Export tab

Setting	Default	Effect
Size (W × H)	200 × 89	Size of the generated images
First image number	2386	Number of the first image, then +1 for each image
File name pattern	`{id}_{w}x{h}.png`	File names: `{id}` number, `{w}` width, `{h}` height, `{i}` index from 0, `{n}` rank from 1
Simulate 16-bit colors (RGB565)	Ticked	Limits colors to those the TJC screen can display

6. Putting images back, tips and troubleshooting

Golden rule: keep the same number of images, the same size and the same numbers as the original. Otherwise the screen may show an incomplete animation or fail to start properly. The **Analyze a folder** button sets these three values for you.

Putting images back into tjc.tft. Replace the original images with the new ones using your `tjc.tft` editing tool (for example TJC TFT Tool), then flash the screen as usual. Always keep a copy of the original `tjc.tft` before flashing.

Tips

- Heavy fonts (Arial Black, Bahnschrift Bold, Impact) stay readable at 89 px high; thin fonts vanish on the screen.
- Keep RGB565 simulation ticked: the preview then shows exactly the screen's colors.
- For short text, lower the **Max width** to avoid oversized letters.
- The preview GIF is handy for a video or a post before you even flash the printer.

Troubleshooting

Problem	Solution
“Windows protected your PC” at launch	**More info → Run anyway** (unsigned exe)
A font is missing from the list	Choose its .ttf or .otf file with the ••• button
The text touches the edges	Lower the **Max width**, or set a smaller fixed size
“No images named like 1234_200x89.png”	The folder does not hold the images extracted from tjc.tft; check the folder
The preview does not update	A field holds an invalid value (for example an incomplete color); correct it
The animation is too short or too long	Keep the original number of frames; use **Still frames at the end** instead
